Tech Nation UK – Evidence of Significant Technical Contribution (OC3) | Joy Omowaye

Product: [My Best 11](#)

Role: Lead Product Designer (Employed by Ingenious App Studios)

Platform: Android & iOS (Live on Google Play & Apple App Store)

This evidence demonstrates my significant technical contribution as the **lead Product Designer** on My Best 11, a **UK-based** betting application supporting both free gameplay and real-money participation. The product is publicly available and was developed under my employment with Ingenious App Studios.

I was responsible for defining the full product experience from concept through production release including the underlying **interaction logic, user flow architecture, and system behaviour across gameplay and financial transactions.**

IMG 1.0: Google Play Store listing showing My Best 11 live in production with mockups I designed and over 500+ downloads, demonstrating that the product was implemented, released publicly, and used by real users.

Technical Contributions

- Designed the product from onboarding through gameplay, wallet transactions, and payout flows, how users move between **free and paid gameplay states** and how **financial actions are triggered** and validated within the system.
- Created over **500 production-ready screens** across Android and iOS
- Built and maintained a **reusable component-based design system** which **standardised UI behaviour** and reduced inconsistencies during development, allowing engineers to reuse components.
- **Structured** fantasy team selection and prediction submission flows **by defining selection logic, constraints (e.g., player limits, team composition rules)**, and validation states to ensure correct user input before submission
- Designed **wallet** deposit, transaction history, withdrawal, and payout visibility journeys ensuring clarity in financial interactions and **aligning UI states with backend transaction** statuses such as pending, successful, and failed payments
- Implemented **age verification and responsible gaming interfaces** to meet **regulatory** requirements
- Created an [interactive prototype](#) for the full design flows for developers and stakeholders to interact with before launch

- Defined and designed the UX for admin dashboard
- Defined loading, success, failed, and empty states across betting and financial interactions Worked directly with frontend and backend engineers to align UI behaviour with backend logic
- Participated in iterative build testing using **TestFlight** prior to App Store release

All user flows and interaction structures in the live application originate from my design work.

IMG 2.0: Figma screenshot of the design system showing typography, colour styles, and reusable components that I created and applied across the application.

IMG 3.0: [Figma](#) workspace showing the structured organisation of over 500 screens covering onboarding, gameplay, wallet flows, notifications, account management, and system states.

IMG 4.0: Sample screens from the app showing onboarding, gameplay guidance, notifications, and account settings designed for the live product.

IMG 5.0: Slack conversation with the CEO on the official slack channel during product development, discussing design implementation for the app.

IMG 6.0 TestFlight screenshot showing the iOS build used during testing prior to release, demonstrating my involvement in validating user flows during development. **This contribution is also referenced in my referee's recommendation letter confirming my role and involvement in the product under Ingenious App Studios.**
