Tech Nation UK – Evidence of Significant Technical Contribution (OC3) | Joy Omowaye

Product: QuePosts (Live Web App)

Role: Sole Product Designer

Website: queposts.com

QuePosts is a live web platform where businesses and individuals can post listings (business directory, jobs, marketplace items, and events), and where users (buyers) can discover and interact with those listings.

I was the **sole designer** on the project. I defined how the platform works, including how buyers interact with listings, how sellers/listers post and manage listings, and how payments and transactions operate. I worked directly with frontend and backend developers to make sure everything was built as designed.

Technical Contributions

- Defined how users register, log in, and manage their profile including **how authentication states control access** and actions across the platform.
- Created separate user experiences for buyers (people viewing listings) and sellers (people posting listings) by defining **distinct flows, permissions, and interactions for each role**.
- **Structured** the listing creation flow, including required information, preview, and publishing, ensuring a **unified structure** across jobs, marketplace, directory, and events while supporting different behaviours for each listing type.
- Defined how listings appear publicly and how buyers interact with them.
- Designed buyer-to-seller interaction flows (inquiries and engagement actions) from **user action to seller response**, including how these actions are **tracked within the product**.
- Created the seller dashboard flow for receiving, viewing, and responding to buyer messages.
- Defined listing states such as draft, published, and inactive, and how each state appears to buyers and sellers.
- Structured the search and filtering system used to discover listings across categories and **defined system behaviour for loading, empty, and failed states**.
- Designed the payment and transaction flow for paid listings and interactions such as contacting sellers, booking services, or completing checkout.
- Built reusable UI components used across all pages to **ensure consistency, scalability, and efficient developer implementation**.
- Delivered organised Figma design files used directly by developers during implementation.
- Worked with frontend and backend engineers to ensure the interface behaviour matched database responses, routing logic, and payment processes.
- All major user flows and interactions currently visible on **queposts.com** originate from my design decisions.

The product was built and launched based on these designs and is currently accessible at queposts.com.

Image Evidences

IMG 1.0: [Live web app](#) Screenshots of the live QuePosts website (landing page, sign-up page, and listings page), confirming the product is publicly accessible and that listings created through my designed flows are live.

IMG 2.0: [Figma file](#) showing UI screens and collaboration with the devs

IMG 3.0: Reusable components on Figma for easy use by the developers and edits showing scalable design and modern experience

IMG 4.0: WhatsApp conversation with the product owner and developers discussing feature behaviour, evidencing my role in defining how key platform features work.
